First Shifting Theorem:

If  $L\{f(t)\} = \bar{f}(s)$ , then  $L\{e^{at} f(t)\} = \bar{f}(s - a), s - a > 0$

Proof: From the def<sup>n</sup>, we have

$$L\{f(t)\} = \int_0^{\infty} e^{-st} f(t) dt = \bar{f}(s)$$

$$\Rightarrow L\{e^{at} f(t)\} = \int_0^{\infty} e^{-st} \cdot e^{at} f(t) dt$$

$$= \int_0^{\infty} e^{-(s-a)t} f(t) dt = \bar{f}(s - a) \quad (\text{comparing def}^n)$$

Hence Proved

Similarly

If  $L\{f(t)\} = \bar{f}(s)$ , then  $L\{e^{-at} f(t)\} = \bar{f}(s + a)$ ,

Using first shifting theorem we obtain the following result.

$$(i) \quad L(e^{at}) = \frac{1}{s - a} \left( \because L(1) = \frac{1}{s} \right)$$

$$(ii) \quad L(e^{at} t^n) = \frac{n!}{(s - a)^{n+1}}, n = 0, 1, 2, \dots\dots\dots$$

$$(iii) \quad L(e^{at} \sin bt) = \frac{b}{(s - a)^2 + b^2}$$

$$(iv) \quad L(e^{at} \cos bt) = \frac{s - a}{(s - a)^2 + b^2}$$

$$(v) \quad L(e^{at} \sinh bt) = \frac{b}{(s - a)^2 - b^2}$$

$$\therefore L(f(t)) = L(\cos t) = \frac{s}{s^2 + 1} = \bar{f}(s)$$

so, by using result  $L(t^2 f(t)) = \frac{d^2}{ds^2}(\bar{f}(s))$ , we get

$$\begin{aligned} L(t^2 \cos t) &= \frac{d^2}{ds^2} \left( \frac{s}{s^2 + 1} \right) = \frac{d}{ds} \left( \frac{d}{ds} \left( \frac{s}{s^2 + 1} \right) \right) \\ &= \frac{d}{ds} \left( \frac{1 \cdot (s^2 + 1) - s \cdot 2s}{(s^2 + 1)^2} \right) = \frac{d}{ds} \left( \frac{1 - s^2}{(s^2 + 1)^2} \right) \\ &= \frac{-2s \cdot (s^2 + 1)^2 - (1 - s^2) \cdot 2(s^2 + 1) \cdot 2s}{(s^2 + 1)^4} \\ &= \frac{(s^2 + 1) \{ -2s^3 - 2s - 4s + 4s^3 \}}{(s^2 + 1)^4} = \frac{2s^3 - 6s}{(s^2 + 1)^3} \end{aligned}$$

(v) Here  $f(t) = \sin^2 t$

$$\therefore L(\sin^2 t) = L\left(\frac{1 - \cos 2t}{2}\right) = \frac{1}{2}\left(\frac{1}{s} - \frac{s}{s^2 + 4}\right) = \bar{f}(s)$$

So, by using result  $L(t f(t)) = -\frac{d}{ds}(\bar{f}(s))$ , we get

$$\begin{aligned} L(t \sin^2 t) &= -\frac{d}{ds} \left\{ \frac{1}{2} \left( \frac{1}{s} - \frac{s}{s^2 + 4} \right) \right\} = -\frac{1}{2} \frac{d}{ds} \left( \frac{1}{s} - \frac{s}{s^2 + 4} \right) \\ &= -\frac{1}{2} \left( -\frac{1}{s^2} - \frac{1 \cdot s^2 + 4 - s \cdot 2s}{(s^2 + 4)^2} \right) = \frac{1}{2s^2} + \frac{4 - s^2}{2(s^2 + 4)^2} \end{aligned}$$

(vi) Here  $f(t) = \cos 2t$

$$\therefore L(\cos 2t) = \frac{s}{s^2 + 4} = \bar{f}(s)$$

So, by using result  $L(t f(t)) = -\frac{d}{ds}(\bar{f}(s))$ , we get

$$L(t \cos 2t) = -\frac{d}{ds} \left( \frac{s}{s^2 + 4} \right) = -\frac{1 \cdot s^2 + 4 - s \cdot 2s}{(s^2 + 4)^2} = \frac{4 - s^2}{(s^2 + 4)^2}$$

(vii) We have  $L(\sin 4t) = \frac{4}{s^2 + 16}$

So, by using result  $L(t f(t)) = -\frac{d}{ds}(\bar{f}(s))$ , we get

$$L(t \sin 4t) = -\frac{d}{ds} \left( \frac{4}{s^2 + 16} \right) = -\frac{0 - 4 \cdot 2s}{(s^2 + 16)^2} = \frac{8s}{(s^2 + 16)^2}$$

Now by using first shifting property, we get

$$L(e^{-t} t \sin 4t) = \frac{8(s+1)}{[(s+1)^2 + 16]^2} = \frac{8(s+1)}{(s^2 + 2s + 17)^2}$$

(ix) We have  $L(\cosh t) = \frac{s}{s^2 - 1}$

So, by using result  $L(t f(t)) = -\frac{d}{ds}(\bar{f}(s))$ , we get

$$L(t \cosh t) = -\frac{d}{ds} \left( \frac{s}{s^2 - 1} \right) = -\frac{1 \cdot s^2 - 1 - s \cdot 2s}{(s^2 - 1)^2} = \frac{s^2 + 1}{(s^2 - 1)^2}$$

Now by using first shifting property, we get

$$L(e^{-t} t \cosh t) = \frac{(s+1)^2 + 1}{[(s+1)^2 - 1]^2} = \frac{s^2 + 2s + 2}{(s^2 + 2s)^2}$$

(viii) Here  $f(t) = \sin 3t \cdot \cos 2t$

$$\begin{aligned} \therefore L(\sin 3t \cdot \cos 2t) &= \frac{1}{2} L(2 \sin 3t \cdot \cos 2t) \\ &= \frac{1}{2} L(\sin 5t + \sin t) = \frac{1}{2} \left( \frac{5}{s^2 + 25} + \frac{1}{s^2 + 1} \right) = \bar{f}(s) \end{aligned}$$

So, using result  $L(t f(t)) = -\frac{d}{ds}(\bar{f}(s))$ , we get

$$\begin{aligned} L(t \cdot \sin 3t \cos 2t) &= -\frac{d}{ds} \frac{1}{2} \left( \frac{5}{s^2 + 25} + \frac{1}{s^2 + 1} \right) = -\frac{1}{2} \left( \frac{0 - 5 \cdot 2s}{(s^2 + 25)^2} + \frac{0 - 2s}{(s^2 + 1)^2} \right) \\ &= -\frac{1}{2} \left( \frac{-10s}{(s^2 + 25)^2} + \frac{-2s}{(s^2 + 1)^2} \right) = \frac{5s}{(s^2 + 25)^2} + \frac{s}{(s^2 + 1)^2} \end{aligned}$$

(x) Here  $f(t) = \sin at$

$$\therefore L(\sin at) = \frac{a}{s^2 + a^2} = \bar{f}(s)$$

So by using result  $L(t^2 f(t)) = \frac{d^2}{ds^2}(\bar{f}(s))$ , we get

$$\begin{aligned} L(t^2 \sin at) &= \frac{d^2}{ds^2} \left( \frac{a}{s^2 + a^2} \right) = \frac{d}{ds} \left( \frac{d}{ds} \left( \frac{a}{s^2 + a^2} \right) \right) \\ &= \frac{d}{ds} \left( \frac{0 - a \cdot 2s}{(s^2 + a^2)^2} \right) = -2a \frac{d}{ds} \left( \frac{s}{(s^2 + a^2)^2} \right) \\ &= -2a \left( \frac{1 \cdot (s^2 + a^2)^2 - s \cdot 2(s^2 + a^2) \cdot 2s}{(s^2 + a^2)^4} \right) \\ &= \frac{-2a(s^2 + a^2) \{s^2 + a^2 - 4s^2\}}{(s^2 + a^2)^4} = \frac{-2a(a^2 - 3s^2)}{(s^2 + a^2)^3} \end{aligned}$$

### Matrix Addition

If A and B are two comparable matrices each of order  $m \times n$  then the addition  $A + B$  be a matrix obtained by adding the corresponding element of A and B.

$$\text{Ex: } A = \begin{bmatrix} 1 & -2 & 3 \\ 4 & 1 & 7 \end{bmatrix}_{2 \times 3} \quad B = \begin{bmatrix} 1 & 5 & 5 \\ 2 & 6 & -1 \end{bmatrix}_{2 \times 3}$$

$$\text{Ans: } A + B = \begin{bmatrix} 1 & -2 & 3 \\ 4 & 1 & 7 \end{bmatrix}_{2 \times 3} + \begin{bmatrix} 1 & 5 & 5 \\ 2 & 6 & -1 \end{bmatrix}_{2 \times 3} = \begin{bmatrix} 1+1 & -2+5 & 3+5 \\ 4+2 & 1+6 & 7-1 \end{bmatrix} = \begin{bmatrix} 2 & 3 & 8 \\ 6 & 7 & 6 \end{bmatrix}_{2 \times 3}$$

### Scalar multiplication of a matrix

If A be a matrix and k be a scalar then the scalar multiplication of a matrix obtained by multiplying each element of A by k. It is denoted by kA.

### Rank of a matrix

The rank of a matrix is the largest order of any non vanishing minor of the matrix.

OR

The rank of a matrix is the maximum number L.I (Linear independent) rows or columns of the matrix.

OR

The number of non zero rows or columns of a triangular matrix is known as rank of a matrix.

Rank of a matrix is denoted by  $\rho(A)$  or  $r(A)$

### How to find the rank of a matrix

1. Let the given matrix is A

2. Before finding rank check the pivot element ( $a_{11} \neq 0$ ) (i.e the 1st element in the matrix not zero)

3. If the pivot element ( $a_{11} = 0$ ) then interchange any two rows or columns.

4. Transfer all the elements below the pivot elements to '0' and reduce the matrix to an upper triangular matrix form.

5. After upper triangular matrix (rank of matrix = number of non zero rows or columns)

Note : If we interchange any two rows or columns of a matrix then the rank of a matrix remains unchanged.

Note :

1. If all minor of a matrix of order  $(r+1)$  are zero then its rank is  $\leq r$ .

2. Rank of  $n$ th order non singular matrix is  $n$ .

3. Rank of  $n$ th order singular matrix is  $< n$ .

4. Rank of  $n$ th order square matrix is  $\leq n$ .

5. Rank of  $n$ th order unit matrix is  $n$ .

6. Rank of a matrix having order  $m \times n$

(a) If  $m > n$  then rank is  $\leq n$

(b) If  $m < n$  then rank is  $\leq m$

(c) If  $m = n$  then rank is  $\leq m = n$

7. The rank of null matrix is zero.

Ex : Find the rank of the matrix  $\begin{bmatrix} 2 & 3 \\ 4 & 6 \end{bmatrix}$

Ans :  $A = \begin{bmatrix} 2 & 3 \\ 4 & 6 \end{bmatrix}$

$|A| = \begin{vmatrix} 2 & 3 \\ 4 & 6 \end{vmatrix} = 0$  , the 2nd order minor vanishes. so the rank of the matrix is 1.

Ex: Find the rank of the matrix  $\begin{bmatrix} 1 & 2 & 3 \\ 1 & 4 & 2 \\ 2 & 6 & 5 \end{bmatrix}$

Ans:  $\begin{bmatrix} 1 & 2 & 3 \\ 1 & 4 & 2 \\ 2 & 6 & 5 \end{bmatrix}$  (Here the 3rd order determinant vanishes.)

$R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - 2R_1$

$$\approx \begin{bmatrix} 1 & 2 & 3 \\ 0 & 2 & -1 \\ 0 & 2 & -1 \end{bmatrix}$$

$R_3 \rightarrow R_3 - R_2$

$$\approx \begin{bmatrix} 1 & 2 & 3 \\ 0 & 2 & -1 \\ 0 & 0 & 0 \end{bmatrix} \text{ (two non zero rows and one zero row are present after upper triangular matrix)}$$

Hence the rank of the matrix is 2 i.e.  $r(A) = 2$ .

Ex: Find the rank of the matrix  $\begin{bmatrix} 4 & 2 & 3 \\ 8 & 4 & 6 \\ -2 & -1 & -1.5 \end{bmatrix}$

Ans:  $\begin{bmatrix} 4 & 2 & 3 \\ 8 & 4 & 6 \\ -2 & -1 & -1.5 \end{bmatrix}$  (Here the 3rd order determinant vanishes.)

$R_2 \rightarrow R_2 - 2R_1, R_3 \rightarrow R_3 + \frac{1}{2}R_1$

$$\approx \begin{bmatrix} 4 & 2 & 3 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \text{ (two zero rows and one non zero row are present after simplification)}$$

Hence the rank of the matrix is 1 i.e.  $r(A) = 1$ .

Ex: Find the rank of the matrix  $\begin{bmatrix} 3 & -1 & 2 \\ -6 & 2 & 4 \\ -3 & 1 & 2 \end{bmatrix}$

$$\text{Ans: } \begin{bmatrix} 3 & -1 & 2 \\ -6 & 2 & 4 \\ -3 & 1 & 2 \end{bmatrix}$$

(Here the 3rd order determinant vanishes.)

$$R_2 \rightarrow R_2 + 2R_1, R_3 \rightarrow R_3 + R_1$$

$$\approx \begin{bmatrix} 3 & -1 & 2 \\ 0 & 0 & 8 \\ 0 & 0 & 4 \end{bmatrix}$$

$$R_3 \rightarrow R_3 - \frac{1}{2}R_2$$

$$\approx \begin{bmatrix} 3 & -1 & 2 \\ 0 & 0 & 8 \\ 0 & 0 & 0 \end{bmatrix}$$

Hence the rank of the matrix is 2 i.e.  $r(A) = 2$ .

$$\text{Ex: Find the rank of the matrix } \begin{bmatrix} 1 & 5 & 9 \\ 4 & 8 & 12 \\ 7 & 11 & 15 \end{bmatrix}$$

$$\text{Ex: Find the rank of the matrix } \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$$

$$\text{Ex: Find the rank of the matrix (a) } \begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 5 \end{bmatrix}, (b) \begin{bmatrix} 0 & 0 & 1 \\ 0 & 2 & 0 \\ 1 & 0 & 2 \end{bmatrix}, (c) \begin{bmatrix} 1 & -1 & 1 \\ -1 & 1 & -1 \\ 2 & -2 & 2 \end{bmatrix}$$

$$\text{Ex: Find the rank of the matrix } \begin{bmatrix} 1 & 2 & 3 & 0 \\ 2 & 4 & 3 & 2 \\ 3 & 2 & 1 & 3 \\ 6 & 8 & 7 & 5 \end{bmatrix}$$

$$\text{Ans: } \begin{bmatrix} 1 & 2 & 3 & 0 \\ 2 & 4 & 3 & 2 \\ 3 & 2 & 1 & 3 \\ 6 & 8 & 7 & 5 \end{bmatrix}$$

$$R_2 \rightarrow R_2 - 2R_1, R_3 \rightarrow R_3 - 3R_1, R_4 \rightarrow R_4 - 6R_1$$

$$\approx \begin{bmatrix} 1 & 2 & 3 & 0 \\ 0 & 0 & -3 & 2 \\ 0 & -4 & -8 & 3 \\ 0 & -4 & -11 & 5 \end{bmatrix}$$

$$R_4 \rightarrow R_4 - R_3 - R_2$$

$$\approx \begin{bmatrix} 1 & 2 & 3 & 0 \\ 0 & 0 & -3 & 2 \\ 0 & -4 & -8 & 3 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

Hence the rank of the matrix is 3 i.e.  $r(A) = 3$ .

Ex: Find the rank of the matrix  $\begin{bmatrix} 5 & 6 & 7 & 8 \\ 6 & 7 & 8 & 9 \\ 11 & 12 & 13 & 14 \\ 16 & 17 & 18 & 19 \end{bmatrix}$

Ans:  $\begin{bmatrix} 5 & 6 & 7 & 8 \\ 6 & 7 & 8 & 9 \\ 11 & 12 & 13 & 14 \\ 16 & 17 & 18 & 19 \end{bmatrix}$

$$C_2 \rightarrow C_2 - C_1, C_3 \rightarrow C_3 - C_2, C_4 \rightarrow C_4 - C_3$$

$$\approx \begin{bmatrix} 5 & 1 & 1 & 1 \\ 6 & 1 & 1 & 1 \\ 11 & 1 & 1 & 1 \\ 16 & 1 & 1 & 1 \end{bmatrix}$$

$$C_3 \rightarrow C_3 - C_2, C_4 \rightarrow C_4 - C_3$$

$$\approx \begin{bmatrix} 5 & 1 & 0 & 0 \\ 6 & 1 & 0 & 0 \\ 11 & 1 & 0 & 0 \\ 16 & 1 & 0 & 0 \end{bmatrix}$$

Hence the rank of the matrix is 2 i.e.  $r(A) = 2$ .

consistent and inconsistent

If the solution of the system of linear equation exist then it is called consistent otherwise it is called inconsistent.

Consistency for system of linear equations

Let us consider the system of 'm' linear equation with 'n' unknowns

$$\left. \begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= d_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= d_2 \\ \dots & \\ \dots & \\ a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n &= d_m \end{aligned} \right\} \dots \dots \dots (1)$$

Now equation (1) can be written in the form of  $AX = B$

$$\text{Where } A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \dots & \dots & \dots & \dots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}, \quad X = \begin{bmatrix} x_1 \\ x_2 \\ \cdot \\ \cdot \\ x_n \end{bmatrix}, \quad B = \begin{bmatrix} d_1 \\ d_2 \\ \cdot \\ \cdot \\ d_m \end{bmatrix}$$

Here A is called coefficient matrix.

$$\text{Let } K = \left[ \begin{array}{cccc|c} a_{11} & a_{12} & \dots & a_{1n} & d_1 \\ a_{21} & a_{22} & \dots & a_{2n} & d_2 \\ \dots & \dots & \dots & \dots & \cdot \\ a_{m1} & a_{m2} & \dots & a_{mn} & d_m \end{array} \right] \text{ which is called augmented matrix .}$$

Rouche's Theorem

The system of equation is consistent iff the rank of A and K are equal otherwise the system of equation is inconsistent.

Note :

- (1) If system of equation is consistent then it gives either unique solution or infinite solution. i.e it has at least one solution.
- (2) If system of equation is inconsistent then it gives no solution.

procedure for the test of consistency

Let the rank of coefficient matrix  $(A) = r$  and the rank of augmented matrix  $(K) = r'$

Number of variables =  $n$

No solution

If  $r \neq r'$  then equations are inconsistent and gives no solution.

Unique solution

(2) If  $r = r' = n$  then equations are consistent and gives unique solution.

Infinite solution

(3) If  $r = r' < n$  then equations are consistent and gives infinite solution.

Ex :

Test the consistency

$$\begin{aligned}4x - 2y + 6z &= 8 \\x + y - 3z &= -1 \\15x - 3y + 9z &= 21\end{aligned}$$

Ans :

The augmented matrix is

$$K = \left[ \begin{array}{ccc|c} 4 & -2 & 6 & 8 \\ 1 & 1 & -3 & -1 \\ 15 & -3 & 9 & 21 \end{array} \right]$$

$R_1 \leftrightarrow R_2$  (Two rows are interchanged)

$$\approx \left[ \begin{array}{ccc|c} 1 & 1 & -3 & -1 \\ 4 & -2 & 6 & 8 \\ 15 & -3 & 9 & 21 \end{array} \right]$$

$R_2 \rightarrow R_2 - 4R_1, R_3 \rightarrow R_3 - 15R_1$

$$\approx \left[ \begin{array}{ccc|c} 1 & 1 & -3 & -1 \\ 0 & -6 & 18 & 12 \\ 0 & -18 & 54 & 36 \end{array} \right]$$

$R_3 \rightarrow R_3 - 3R_2$

$$\approx \left[ \begin{array}{ccc|c} 1 & 1 & -3 & -1 \\ 0 & -6 & 18 & 12 \\ 0 & 0 & 0 & 0 \end{array} \right]$$

here rank of  $A = 2$  and rank of  $K = 2, n = 3$

So it is consistent and gives infinite solution.

Now  $-6y + 18z = 12 \Rightarrow y - 3z = -2 \Rightarrow y = 3z - 2 \dots \dots (1)$

Again  $x + y - 3z = -1 \Rightarrow x - 2 = -1 \Rightarrow x = 1$  where  $z$  is a parameter.

Ex:

Test the consistency  $2x - 3y + 7z = 5$   
 $3x + y - 3z = 13$   
 $2x + 19y - 47z = 32$

Ans:

The augmented matrix is

$$K = \left[ \begin{array}{ccc|c} 2 & -3 & 7 & 5 \\ 3 & 1 & -3 & 13 \\ 2 & 19 & -47 & 32 \end{array} \right]$$

$R_2 \rightarrow 2R_2 - 3R_1, R_3 \rightarrow R_3 - R_1$

$$\approx \left[ \begin{array}{ccc|c} 2 & -3 & 7 & 5 \\ 0 & 11 & -27 & 11 \\ 0 & 22 & -54 & 27 \end{array} \right]$$

$R_3 \rightarrow R_3 - 2R_2$

$$\approx \left[ \begin{array}{ccc|c} 2 & -3 & 7 & 5 \\ 0 & 11 & -27 & 11 \\ 0 & 0 & 0 & 5 \end{array} \right]$$

here rank of  $A = 2$  and rank of  $K = 3, n = 3$

So it is inconsistent and gives no solution.

Ex:

Test the consistency  $2x - 3y + z = 1$   
 $x + 2y - 3z = 4$   
 $4x - y - 2z = 8$

Ans:

The augmented matrix is

$$K = \left[ \begin{array}{ccc|c} 2 & -3 & 1 & 1 \\ 1 & 2 & -3 & 4 \\ 4 & -1 & -2 & 8 \end{array} \right]$$

$R_2 \rightarrow 2R_2 - R_1, R_3 \rightarrow R_3 - 2R_1$

$$\approx \left[ \begin{array}{ccc|c} 2 & -3 & 1 & 1 \\ 0 & 7 & -7 & 7 \\ 0 & 5 & -4 & 6 \end{array} \right]$$

$$R_3 \rightarrow 7R_3 - 5R_2$$

$$\approx \left[ \begin{array}{ccc|c} 2 & -3 & 1 & 1 \\ 0 & 7 & -7 & 7 \\ 0 & 0 & 7 & 7 \end{array} \right]$$

here rank of  $A = 3$  and rank of  $K = 3, n = 3$

So it is consistent and gives unique solution.

$$\text{Now } 7z = 7 \Rightarrow z = 1$$

$$7y - 7z = 7 \Rightarrow y - z = 1 \Rightarrow y = 1 + z = 1 + 1 = 2$$

$$2x - 3y + z = 1 \Rightarrow 2x - 6 + 1 = 1 \Rightarrow 2x = 6 \Rightarrow x = 3$$

Ex:

Test the consistency and if possible then find solution

$$(a) \quad x + 2y - z = 6$$

$$3x - y - 2z = 3$$

$$4x + 3y + z = 9$$

$$(b) \quad 4x + 3y + 2z = -7$$

$$2x + y - 4z = -1$$

$$x + 2y + z = 1$$

$$(c) \quad 2x - 3y + 7z = 5$$

$$5x - 2y + 4z = 18$$

$$2x + 19y - 47z = 32$$

Ex:

Test the consistency and if possible then find solution

$$x + 2y + z = 3$$

$$2x + 3y + 2z = 5$$

$$3x - 5y + 5z = 2$$

$$3x + 9y - z = 4$$

Ans :

The augmented matrix is

$$K = \left[ \begin{array}{ccc|c} 1 & 2 & 1 & 3 \\ 2 & 3 & 2 & 5 \\ 3 & -5 & 5 & 2 \\ 3 & 9 & -1 & 4 \end{array} \right]$$

$$\left\{ \text{Here } A = \left[ \begin{array}{ccc} 1 & 2 & 1 \\ 2 & 3 & 2 \\ 3 & -5 & 5 \\ 3 & 9 & -1 \end{array} \right] \right\}$$

$$R_2 \rightarrow R_2 - 2R_1, R_3 \rightarrow R_3 - 3R_1, R_4 \rightarrow R_4 - 3R_1$$

$$\approx \left[ \begin{array}{ccc|c} 1 & 2 & 1 & 3 \\ 0 & -1 & 0 & -1 \\ 0 & -11 & 2 & -7 \\ 0 & 3 & -4 & -5 \end{array} \right]$$

$$R_3 \rightarrow R_3 - 11R_2, R_4 \rightarrow R_4 + 3R_2$$

$$\approx \left[ \begin{array}{ccc|c} 1 & 2 & 1 & 3 \\ 0 & -1 & 0 & -1 \\ 0 & 0 & 2 & 4 \\ 0 & 0 & -4 & -8 \end{array} \right]$$

$$R_4 \rightarrow R_4 + 2R_3$$

$$\approx \left[ \begin{array}{ccc|c} 1 & 2 & 1 & 3 \\ 0 & -1 & 0 & -1 \\ 0 & 0 & 2 & 4 \\ 0 & 0 & 0 & 0 \end{array} \right]$$

here rank of  $A = 3$  and rank of  $K = 3, n = 3$

So it is consistent and gives unique solution.

$$\text{Now } 2z = 4 \Rightarrow z = 2$$

$$-y = -1 \Rightarrow y = 1$$

$$x + 2y + z = 3 \Rightarrow x + 2 + 2 = 3 \Rightarrow x = -1$$

Ex :

Test the consistency and if possible then find solution

$$x + 5y + 7z = 15$$

$$2x + 3y + 4z = 11$$

$$x - 2y - 3z = -4$$

$$3x + 11y + 13z = 25$$

Ex : Investigate for what value of  $\lambda$  and  $\mu$  the simultaneous equation

$$x + y + z = 6$$

$$x + 2y + 3z = 10$$

$x + 2y + \lambda z = \mu$  has (a) no solution, (b) a unique, (c) an infinite number of solution

$$\text{Ans : Here } A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 2 & \lambda \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix}, B = \begin{bmatrix} 6 \\ 10 \\ \mu \end{bmatrix}$$

$$\text{Now } K = \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 6 \\ 1 & 2 & 3 & 10 \\ 1 & 2 & \lambda & \mu \end{array} \right]$$

$$R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$$

$$\approx \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 6 \\ 0 & 1 & 2 & 4 \\ 0 & 0 & \lambda - 3 & \mu - 10 \end{array} \right]$$

No solution

If  $\lambda = 3$  and  $\mu \neq 10$  then rank of  $A = 2$ , rank of  $K = 3$

Unique solution

If  $\lambda \neq 3$  and  $\mu$  be any value then rank of  $A = \text{rank of } K = 3$

Infinite solution

If  $\lambda = 3$  and  $\mu = 10$  then rank of  $A = \text{rank of } K = 2 < n (n = 3)$

Ex : Show that the equations

$$3x + 4y + 5z = a$$

$$4x + 5y + 6z = b$$

$5x + 6y + 7z = c$  do not have a solution unless  $a + c = 2b$ .

$$\text{Ans : Here } A = \begin{bmatrix} 3 & 4 & 5 \\ 4 & 5 & 6 \\ 5 & 6 & 7 \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix}, B = \begin{bmatrix} a \\ b \\ c \end{bmatrix}$$

$$\text{Now } K = \left[ \begin{array}{ccc|c} 3 & 4 & 5 & a \\ 4 & 5 & 6 & b \\ 5 & 6 & 7 & c \end{array} \right]$$

$$R_2 \rightarrow 3R_2 - 4R_1, R_3 \rightarrow 3R_3 - 5R_1$$

$$\approx \left[ \begin{array}{ccc|c} 3 & 4 & 5 & a \\ 0 & -1 & -2 & 3b-4a \\ 0 & -2 & -4 & 3c-5a \end{array} \right]$$

$$R_3 \rightarrow R_3 - 2R_2$$

$$\approx \left[ \begin{array}{ccc|c} 3 & 4 & 5 & a \\ 0 & -1 & -2 & 3b-4a \\ 0 & 0 & 0 & 3c-6b+3a \end{array} \right]$$

$$\text{Rank of } A = 2$$

The system of equation is consistent if the rank of augmented matrix  $K = 2$

which is obtained if  $3c - 6b + 3a = 0$

$$\Rightarrow 3c + 3a = 6b \Rightarrow a + c = 2b$$

Hence the equation have no solution unless  $a + c = 2b$ .
